

One real job in your business

Notes from the Buildwise talk | Keep the task small enough to check.

Choose the task

Name the work that keeps coming back to the owner. A useful first job has clear inputs and a result a person can review. Drafting a follow-up note is one example. Sending it needs its own permission.

Give it the right facts

Choose the approved records and instructions the task needs. A tool should say when facts are missing. It should not fill the gaps with guesses.

Set the limits first

Decide what the tool may do, what needs a person's yes, and how to pause it. Name the person who will check the work. AI can make mistakes.

Try a small sample

Check a few approved examples before wider use. Compare the time spent, the errors and the changes needed with the current way of doing the task. Fix the task or its inputs when a result is wrong.

Use work you can inspect

The Buildwise team has built a lead review tool, a working construction-bid review demo, and websites with clear details for people and AI readers. The construction demo does not calculate prices or submit bids. None of these examples promises the same result for every business.

Take the next step

Finish the one-page worksheet. If you want help with your first job, you can ask the Buildwise team through the materials page. The request is optional and does not start paid work.
